Conflict means : Tadakhol

We have 2 kind of conflicts in using Git:

1.merge conflict:

It happens when a file changed in two different branch and when we try merge these two branch.

Solution: to fix this problem we should compare two branches changes and select one of them and delete other one.

2.github conflict:

When we are working on a project as part of a team, it can be happens that I make changes on a file and at the same time another teammate did it too

So if I try to merge my branch with branch master git will raise an error

Solution:

First I have to use <git pull>

Now in my local project I can decide

Which one I want to keep on branch master and which one will be deleted
